

# Prepared Media in Ampoules

Redipor® ampoules offer the convenience of having a small volume of media in individually sealed containers, which minimises the risk of ingress of external contamination. The ampoules are commonly used in laboratories for microbiology research and development, cultivation of microorganisms and during operator training for the validation of aseptic techniques. With a maximum capacity of either 10ml or 20ml the ampoules can be filled with different media such as Tryptone Soya Broth or demineralised water. These are presented as either aseptically filled or terminally sterilised ampoules.

## Aseptically Filled Ampoules

To facilitate production, gamma irradiated empty ampoules are aseptically filled with the required sterile media before sealing with the ampoule sealer. The ampoules are individually labelled and packaged either by heat sealing in polybags or presented in cardboard boxes. These are further packaged in an outer box in accordance to the required packaging specifications.

## Terminally Sterilised Ampoules

Similar to aseptically filled ampoules, gamma irradiated empty ampoules are aseptically filled with media and sealed before terminally sterilising the ampoules by autoclaving. Post terminal sterilisation. The ampoules are individually labelled and packaged in accordance to the required packaging specifications.

## Technical Data

|                             | Information  |
|-----------------------------|--|
| <b>Size</b>                 | 10ml, 20ml   |
| <b>Component Material</b>   | Glass Type 1   |
| <b>Product presentation</b> | Aseptically filled or terminal sterilisation - by autoclave<br>Ampoules coloured appearance is due to the process when irradiating the empty sterile ampoules, however this does not affect the quality or performance of the glass ampoules |
